

SGM2053S

500mA, Ultra-Low Dropout, Low Power, RF Linear Regulator

GENERAL DESCRIPTION

The SGM2053S is a low power, low noise, fast transient response and low dropout voltage linear regulator which is designed using CMOS technology. It provides 500mA output current capability. The operating input voltage range is from 1.6V to 5.5V. The adjustable output voltage range is from 0.8V to 5.0V.

Other features include logic-controlled shutdown mode, short-circuit current limit and thermal shutdown protection. The SGM2053S has automatic discharge function to quickly discharge V_{OUT} in the disabled status.

The SGM2053S is available in Green SOT-23-6 and SOT-23-5 packages. It operates over an operating temperature range of -40°C to $+125^{\circ}\text{C}$.

FEATURES

- Operating Input Voltage Range: 1.6V to 5.5V
- Enable Pin Accept Voltages Higher than the Supply Voltage and up to 5.5V
- Fixed Output from 1.0V to 3.3V
- Adjustable Output from 0.8V to 5.0V
- 500mA Output Current
- Ultra-Low Dropout Voltage:
245mV (TYP) at $V_{OUT} = 5.0\text{V}$
- Shutdown Supply Current: 0.05 μA (TYP)
- High PSRR: 76dB (TYP) at 1kHz
- Turn-On Time: 80 μs (TYP)
- Current Limiting and Thermal Protection
- Excellent Load and Line Transient Responses
- With Output Automatic Discharge
- Stable with Small Case Size Ceramic Capacitors
- -40°C to $+125^{\circ}\text{C}$ Operating Temperature Range
- Available in Green SOT-23-6 and SOT-23-5 Packages

APPLICATIONS

Portable Equipment

Smartphone

Industrial and Medical Equipment

PACKAGE/ORDERING INFORMATION

YYY X X

Green (RoHS & HSF): SG Micro Corp defines "Green" to mean Pb-Free (RoHS compatible) and free of halogen substances. If you have additional comments or questions, please contact your SGMICRO representative directly.

ABSOLUTE MAXIMUM RATINGS

IN to GND	-0.3V to 6V
EN to GND	-0.3V to 6V
OUT, BP, ADJ to GND	-0.3V to ($V_{IN} + 0.3V$)
Package Thermal Resistance	
SOT-23-6, θ_{JA}	207°C/W
SOT-23-6, θ_{JB}	70°C/W
SOT-23-6, θ_{JC}	124°C/W
SOT-23-5, θ_{JA}	221°C/W
SOT-23-5, θ_{JB}	74°C/W
SOT-23-5, θ_{JC}	120°C/W
Junction Temperature	+150°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature (Soldering, 10s)	+260°C
ESD Susceptibility	
HBM	3000V
CDM	1000V

RECOMMENDED OPERATING CONDITIONS

Input Supply Voltage Range	1.6V to 5.5V
Enable Input Voltage Range	0V to 5.5V
Input Effective Capacitance, C_{IN}	0.5 μ F (MIN)
Output Effective Capacitance, C_{OUT}	1 μ F to 10 μ F
Operating Junction Temperature Range	-40°C to +125°C

OVERSTRESS CAUTION

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

DISCLAIMER

SG Micro Corp reserves the right to make any change in circuit design, or specifications without prior notice.

PIN CONFIGURATIONS

PIN DESCRIPTION

PIN		NAME	FUNCTION
SOT-23-6	SOT-23-5		
1	1	IN	Input Voltage Supply Pin. It is recommended to use a 1 μ F or larger ceramic capacitor from IN pin to ground to get good power supply decoupling.
2	2	GND	Ground.
3	3	EN	Enable Pin. Drive EN high to turn on the regulator. Drive EN low to turn off the regulator. The EN pin has an internal pull-down resistance which ensures that the device is turned off when the EN pin is floated.
4	4	BP	Reference-Noise Bypass Pin (fixed voltage version only for SOT-23-5 package). Bypass with an external capacitor C _{BP} can reduce output noise to very low level. If not used, this pin must be left floating.
5	4	ADJ	Feedback Input Pin (adjustable voltage version only). Connect this pin to the external resistor divider to adjust the output voltage. Place the resistors as close as possible to this pin.
	—	NC	Not Connected (fixed voltage version only).
6	5	OUT	Regulator Output Pin. It is recommended to use an output capacitor with effective capacitance in the range of 1 μ F to 10 μ F to ensure stability. This ceramic capacitor should be placed as close as possible to OUT pin.

FUNCTIONAL BLOCK DIAGRAMS

Figure 4. Adjustable Output Voltage Version (SOT-23-6 Version)

Figure 5. Adjustable Output Voltage Version (SOT-23-5 Version)

APPLICATION INFORMATION

The SGM2053S is a low input voltage, low noise and low dropout LDO and provides 500mA output current. These features make the device a reliable solution to solve many challenging problems in the generation of clean and accurate power supply. The high performance also makes the SGM2053S useful in a variety of applications. The SGM2053S provides the protection functions for output overload, output short-circuit condition and overheating.

The SGM2053S provides an EN pin as an external chip enable control to enable/disable the device. When the regulator is in shutdown state, the shutdown current consumes as low as 0.05μA (TYP).

Input Capacitor Selection (C_{IN})

The input decoupling capacitor should be placed as close as possible to the IN pin to ensure the device stability. A 1μF or greater X7R or X5R ceramic capacitor is selected to get good dynamic performance.

When V_{IN} is required to provide large current instantaneously, a large effective input capacitor is required. Multiple input capacitors can reduce the impact from input trace inductance. Adding more input capacitors is available to restrict the ringing and to keep it below the device absolute maximum ratings. For C_{OUT} with larger capacitance, it is recommended to choose the larger capacitance C_{IN} .

Output Capacitor Selection (C_{OUT})

One or more output capacitors are required to maintain the stability of the LDO, and the output capacitors should be placed as close as possible to the OUT pin. In addition, in order to obtain the best transient performance, it is recommended to use X7R and X5R ceramic capacitors as output capacitors. Ceramic capacitors have low equivalent series resistance (ESR), excellent temperature and DC bias characteristics. However, it cannot be ignored that the effective capacitance of ceramic capacitors is affected by temperature, DC bias and package size.

For example, Figure 6 shows the capacitance and DC bias and temperature characteristics of 0805, 10V, 10μF±10%, X7R capacitor. Therefore, it is necessary to evaluate whether the effective capacitance of the output capacitor can meet the stability requirements of the LDO in practical applications. In general, a capacitor in higher voltage rating and a larger package exhibits better stability, and the effective capacitance can be obtained from the manufacturer datasheet.

Figure 6. Capacitance vs. DC Bias and Temperature Characteristics

The SGM2053S requires a minimum effective capacitance of 1μF for C_{OUT} to ensure stability. Additionally, C_{OUT} with larger capacitance and lower ESR will help increase the high frequency PSRR and improve the load transient response.

Adjustable Regulator

The output voltage of the SGM2053S-ADJ can be adjusted from 0.8V to 5.0V. The ADJ pin will be connected to two external resistors as shown in Figure 7, the output voltage is determined by the following equation:

$$V_{OUT} = V_{ADJ} \times \left(1 + \frac{R_1}{R_2}\right) \quad (1)$$

where:

V_{OUT} is output voltage and V_{ADJ} is the internal voltage reference, $V_{ADJ} = 0.8V$.

One parallel capacitor (C_{FF}) with R_1 can be used to improve the feedback loop stability and PSRR, increase the transient response and reduce the output noise. Use $R_2 = 160k\Omega$ to maintain a 5μA minimum load.

Figure 7. Adjustable Output Voltage Application (SOT-23-6 Version)

APPLICATION INFORMATION (continued)

Enable Operation

The EN pin of the SGM2053S is used to enable/disable its device and to deactivate/activate the output automatic discharge function.

When the EN pin voltage is lower than 0.4V, the device is in shutdown state. There is no current flowing from IN to OUT pins. In this state, the automatic discharge transistor is active to discharge the output voltage through a 70Ω (TYP) resistor.

When the EN pin voltage is higher than 1.5V, the device is in active state. The output voltage is regulated to the expected value and the automatic discharge transistor is turned off.

The EN pin is pulled down by an internal pull-down resistor when the EN pin is floated. This resistance will ensure the SGM2053S in shutdown state and reduce the power dissipation in system.

Reverse Current Protection

The power transistor has an inherent body diode. This body diode will be forward biased when $V_{OUT} > (V_{IN} + 0.3V)$. When $V_{OUT} > (V_{IN} + 0.3V)$, the reverse current flowing from the OUT pin to the IN pin will damage the SGM2053S. If $V_{OUT} > (V_{IN} + 0.3V)$ event would happen in system, one external Schottky diode will be added between OUT pin and IN pin in circuit design to protect the SGM2053S.

Figure 8. Reverse Protection Reference Design

Negatively Biased Output

When the output voltage is negative, the chip may not start up due to parasitic effects. Ensure that the output is greater than -0.3V under all conditions. If negatively biased output is excessive and expected in the application, a Schottky diode can be added between the OUT pin and GND pin.

Figure 9. Negatively Biased Output Application

Output Current Limit and Short-Circuit Protection

When overload events happen, the output current is internally limited to 730mA (TYP). When the OUT pin is shorted to ground, the short-circuit protection will limit the output current to 380mA (TYP).

Thermal Shutdown

When the die temperature exceeds the threshold value of thermal shutdown, the SGM2053S will be in shutdown state and it will remain in this state until the die temperature decreases to +140°C.

Power Dissipation (P_D)

Power dissipation (P_D) of the SGM2053S can be calculated by the equation $P_D = (V_{IN} - V_{OUT}) \times I_{OUT}$. The maximum allowable power dissipation ($P_{D(MAX)}$) of the SGM2053S is affected by many factors, including the difference between junction temperature and ambient temperature ($T_{J(MAX)} - T_A$), package thermal resistance from the junction to the ambient environment (θ_{JA}), the rate of ambient airflow and PCB layout. $P_{D(MAX)}$ can be approximated by the following equation:

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA} \quad (2)$$
