## 8-Bit Dual-Supply Bus Transceiver with Configurable Voltage Translation and 3-State Outputs

### GENERAL DESCRIPTION

The SGM8T245S is an 8-bit bus transceiver with configurable voltage translation and 3-state outputs. The An and Bn are 8-bit data input and output ports, DIR is the direction control input and  $\overline{OE}$  is an output enable input.  $V_{CCA}$  and  $V_{CCB}$  are dual-supply pins. The supply voltage of  $V_{CCA}$  and  $V_{CCB}$  can range from 1.2V to 5.5V, making the device suitable for bidirectional translating among any of the 1.2V, 1.5V, 1.8V, 2.5V, 3.3V and 5.5V voltage nodes. The An, DIR and  $\overline{OE}$  pins are referenced to  $V_{CCA}$ , and Bn pins are referenced to  $V_{CCB}$ .

The direction control (DIR) input determines the direction of the data flow. The DIR (active high) enables data from An ports to Bn ports. The DIR (active low) enables data from Bn ports to An ports. When the output enable ( $\overline{OE}$ ) input is high, both An and Bn ports are disabled, so the buses are effectively isolated.

This device is highly suitable for partial power-down applications using power-off leakage current ( $I_{OFF}$ ) circuit. When the device is powered down, the current backflow will be prevented from passing through the device.

## OVERSTRESS CAUTION

- Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.
- The input and output voltage ratings may be exceeded if the input and output clamp current ratings are observed.
- The performance capability of a high-performance integrated circuit in conjunction with its thermal environment can create junction temperatures which are detrimental to reliability.

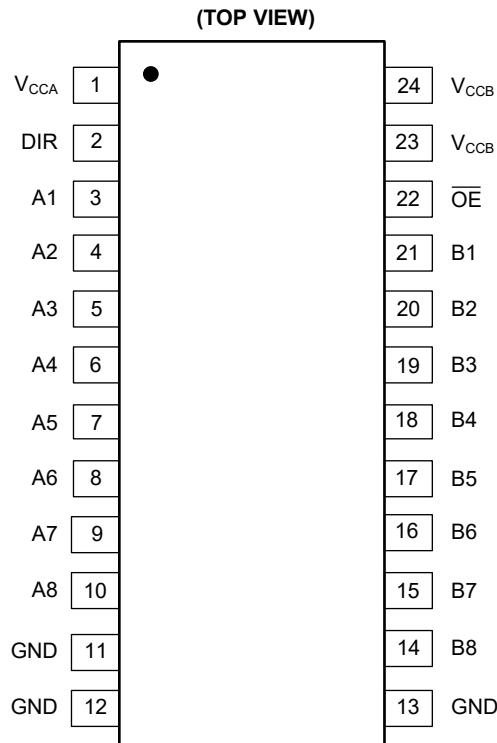

## ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

## NOTES:

- C<sub>PD</sub> is used to determine the dynamic power dissipation (P<sub>D</sub> in  $\mu$ W).

$$P_D = C_{PD} \times V_{CC}^2 \times f_i \times N + \Sigma(C_L \times V_{CC}^2 \times f_o)$$

where:

f<sub>i</sub> = Input frequency in MHz.

f<sub>o</sub> = Output frequency in MHz.

C<sub>L</sub> = Output load capacitance in pF.

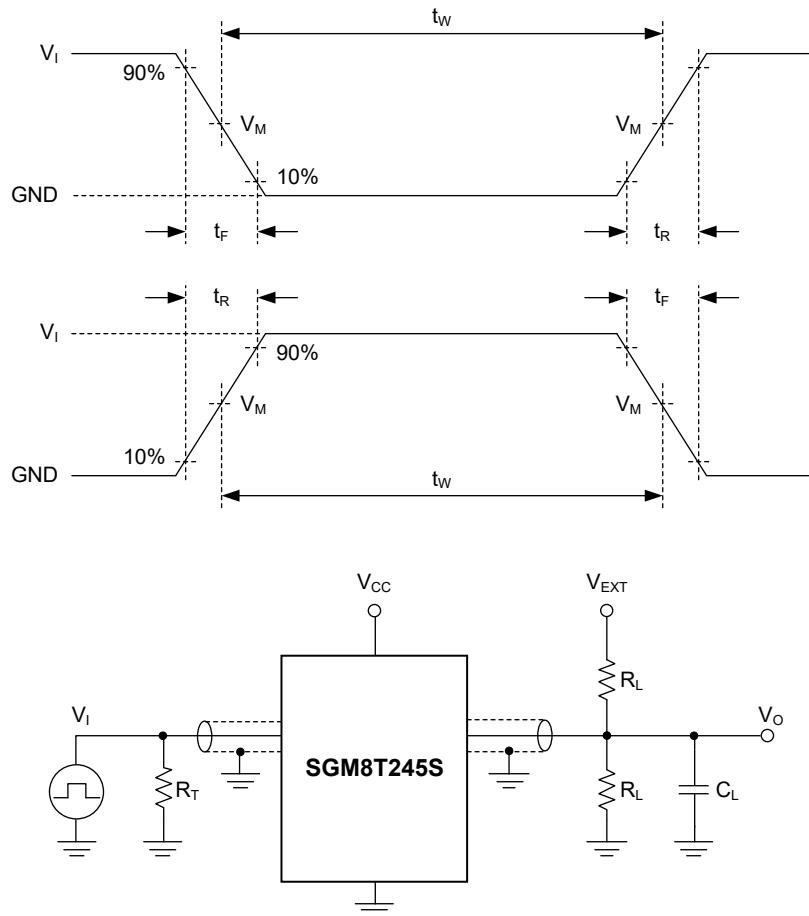

V<sub>CC</sub> = Supply voltage in Volts.

N = Number of inputs switching.

$$\Sigma(C_L \times V_{CC}^2 \times f_o) = \text{Sum of the outputs.}$$

- Per transceiver, f<sub>i</sub> = 10MHz, t<sub>R</sub> = t<sub>F</sub> = 1ns, C<sub>L</sub> = 0pF.

## TEST CIRCUIT

Test conditions are given in Table 1.

Definitions for test circuit:

$R_L$ : Load resistance.

$C_L$ : Load capacitance (includes jig and probe).

$R_T$ : Termination resistance (equals to output impedance  $Z_O$  of the pulse generator).

$V_{EXT}$ : External voltage is used to measure switching time.
